Remmi's Project Progress Report September 2020

At the moment my commodore is looking like this:

I have taken the front panels off the car so that I can change the radiator support panel because it has been in an accident before and it is damaged. If it is not fixed, then the panels won't fit properly. As the bonnet has a bow in it, I will be removing it and replacing it with a better one. This will need to be painted pink.

I have already painted the roof in pink metal flake. All the doors and quarter panels are in primer. To get to this point I sanded them, panel beat and filled the dents. The next thing is to fill the door handles for a custom design. Then paint them gloss black and air brush murals over them.

Here is a picture of the front guards after I took all the paint off with paint stripper and then sanded them. Then I tapped up all the dents and I had to do a bit of welding on one of them which had a little split in it. Then I rust treated them and put etch primer them on, so they don’t rust in the future.

This picture shows the guards after I filled all the dents with filler and sanded them flat. Then I scoured the rest of the guards.

Then painted white primer over them, now I have to sand them all again and paint them and put them back on the car.
